

DoctorApp - Daily Report

Day 3 Submission | Candidate: Junaid Ansari

1. What did you build today?

- **Home Screen (HomeScreen.js)** Complete
Implemented dynamic patient greeting ("Good morning, John Doe"), location row with city ("Pune, India"), a functional header-aligned logout button, a search bar with real-time text input queries, and horizontal specialty chips that filter the list.
- **DoctorCard Component (DoctorCard.js)** Complete
Created a reusable component with initials-based circular avatar placeholders, bold doctor name, specialty details, visual stats row (★ rating | experience | fee), and a green availability badge.
- **Doctor Profile Screen (DoctorProfileScreen.js)** Complete
Built a detailed description layout with large initial avatars, numerical stats (consultations, years, rating), consultation fees, about description, and a full-width blue "Book Appointment" CTA button.
- **Navigation Integration (AuthNavigator.js)** Complete
Registered the profile screen to the Native Stack Navigator with default navigation support.
- **Standalone App Production (DoctorApp-standalone.apk)** Complete
Compiled and assembled a standalone Release APK that bundles all assets offline.

2. What did you learn?

I gained a concrete understanding of how React Native packages assets offline during the `createBundleReleaseJsAndAssets` Gradle task. In debug builds, the JavaScript engine tries to query the Metro Packager running on host port 8081. In standalone release mode, Metro bundles all Javascript source files into a single bundle inside the android assets folder, enabling the app to run completely independent of any server connections.

3. Where did you get stuck?

I got stuck on a duplicate key compilation error in React Native styles for `listContent`. The linter was blocking builds due to this duplicate key. It took me 15 minutes to inspect the styles object, merge the properties (combining horizontal and bottom padding configurations), and revalidate the lint script. Additionally, C++ code compilation for native modules under the React Native New Architecture (Fabric) took about 5 minutes to compile across all four CPU targets.

4. What will you do tomorrow?

Tomorrow, I will start on Day 4's Slot Selection and Booking System. I'll implement a calendar component on the DoctorProfileScreen to choose dates and time slots, and write logic to persist successful bookings so patients can view their scheduled appointments.

6. AI prompts you used today

```
- "you're on day 2 int folder so read the day0 task 3 named txt file and execute it"
- "give me the .app file which i can install from anywhere"
- "the app gives metro is not running error"
- "i want app to be stand alone"
- "make a pdf file containing Daily Report - Submit on WhatsApp group. Answer all six points..."
```
